

# Azure VM Scale Set & Custom Script Extension – Day Tasks Documentation

This repository documents two Azure infrastructure automation tasks performed as part of hands-on cloud practice:

- **Task 1:** Virtual Machine Scale Set (VMSS) creation and autoscaling validation
- **Task 2:** Installing IIS on a Windows VM using Custom Data and Custom Script Extension

## Day Tasks Overview

| Task   | Description                                                   |
|--------|---------------------------------------------------------------|
| Task 1 | VMSS creation using a custom image and autoscaling validation |
| Task 2 | Automated IIS & Chrome installation using Custom Data + CSE   |

---

## Task 1: Creating the Virtual Machine Scale Set (VMSS)

### ◆ Step 1: Create the Base Virtual Machine

A base Virtual Machine was created with the following configurations:

- **Operating System:** Windows / Linux
- **VM Size:** As per workload requirement
- **Networking:**
  - Virtual Network (VNet)

- Subnet
- Network Security Group (NSG)
- **Software:** Required packages installed

 This VM acts as the **golden image source** for VMSS creation.

---

## ◆ Step 2: Create an Image from the VM

Steps performed:

1. Stop (Deallocate) the Virtual Machine
2. Choose Image Type:

| Image Type         | Description                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| Specialized        | Retains machine-specific configuration                                                                                                        |
| <b>Generalized</b> | Removes machine-specific data  <i>Recommended for VMSS</i> |

3.  
Image created via Azure Portal / Azure CLI

---

## ◆ Step 3: Create VM Scale Set from the Image

A **Virtual Machine Scale Set** was created using the custom image.

### Autoscaling Configuration

- **Minimum Instances:** 2
- **Maximum Instances:** Configured as required
- **Default Instances:** Initial VM count

![VMSS Overview](../Images/Screenshot 2026-02-09 151500.png)

---

## ◆ Step 4: Trigger Autoscaling Using Stress Tool

### Actions Performed

- Connected to one VM instance
- Installed stress testing tool
- Executed stress command to increase CPU usage

### Result

- Minimum instances configured → **2**
- After CPU threshold breach → **Scaled to 3 instances**

📌 Autoscaling was triggered automatically by Azure Monitor.
