

DAY 8 TASK ARMs

- Created Storage Account by ARM

The screenshot displays a Windows desktop environment. At the top, a Visual Studio Code editor is open with three files: `storage.json`, `param.json`, and `storage.sh`. The `storage.json` file contains Bicep code for deploying a storage account and a blob container. The `param.json` file defines parameters for the storage account name and container name. The `storage.sh` file contains a deployment command. Below the editor, a terminal window shows the output of the deployment command, indicating that the deployment was successful. At the bottom of the screen, the Microsoft Azure portal is open, showing the 'Overview' page for the resource group 'FardeenAttar-rg'. The page lists various resources, including Virtual machines, Disks, Storage accounts, and Network interfaces, along with their types and locations.

- Created VM by ARM, Custom script Extension ,Installed IIS and Chrome, Ran the Web Application on IIS Server

The image displays the process of creating and running a web application on an Azure Windows 11 Pro VM using ARM templates and Custom Script Extensions.

Visual Studio Code Screenshot:

- azuredeploy.json:** The main ARM template defining the VM and its resources. It includes parameters for VM name, admin username, admin password, and location. It defines variables for the VM name, subnet, and public IP. The resources section includes a network security group (NSG) with an 'Allow-RDP' rule and a virtual machine (VM) with a custom script extension to install IIS and Chrome.
- azuredeploy.parameters.json:** The parameter file providing values for the template parameters.
- arm.sh:** A shell script used by the custom script extension to install IIS and Chrome.
- Terminal:** Shows the command `az vm create` being executed, which creates the VM and its associated resources.

Web Browser Screenshot:

The browser displays the web application running on the Azure Windows 11 Pro VM. The page features a blue header with the text "ðŸŒŽ Azure Windows 11 Pro VM" and "IIS Web Server Successfully Deployed". Below this, it shows the region "Region: East US 2" and a "Click Me" button.

- Created a data Disk and Attached to existing VM by ARM

The screenshot displays the Visual Studio Code interface with three ARM templates open in the editor: `disk.json`, `params.json`, and `disk.sh`. The `disk.json` template defines a data disk resource with properties like `location`, `dataDiskName`, and `diskSizeGB`. The `params.json` template provides parameter values for `vmName`, `location`, `dataDiskName`, and `win11-datadisk01`. The `disk.sh` script contains deployment commands for creating a resource group, a storage account, and a virtual machine with the data disk attached. The terminal window at the bottom shows the execution of the `disk.sh` script, displaying the ARM deployment output.
